## General information

#### Course web page:

http://www.cs.bgu.ac.il/~caspl092

#### Instructors:

**Prof. Eyal Shimony (course coordinator)** 

Office hours:

Building 37 (Alon High-Tech), Room 216

Dr. Jihad El-Sana

TA: Gilad Bauman

Lab assistants:

**Assaf Avihoo** 

**Dror Fried** 

**Ami Berler** 

Rafi Cohen

**David Tolpin** 

**Yoav Goldberg** 

**Udi Apsel** 

### Syllabus:

(see web page)

## Goals and Expectations

### **Architecture and Assembly Language**

- Computer organization:
  - Basic Principles
  - Case study: 80X86
- Computer architecture:
  - Principles
  - Case study: 80X86
- Assembly and machine language
  - Principles
  - HANDS ON experience: 80X86
  - Integration and applications

#### SP lab

- Low-level systems-related programming via handson experience
- Really understanding data

Learning how to RTFM

## SP Lab Issues

- Programming in C: understanding code and data (including pointers).
- Binary files: data structures in files, object code, executable files (ELF).
- System calls: process handling, input and output. Direct system calls.
- Low-level issues in program developement: debugging, patching, hacking.

### Done through:

- Reasoning/exploration from basic principles.
- Implementation of small programs (in C).
- Interacting with Linux OS / systems services.

## IMPORTANT Lessons

At the end of the course, Only REALLY need to KNOW\* two things:

- 1) RTFM
- 2) There is no magic\*\*
- \* KNOW: in "intelligent agent behaviour consistent with knowledge" meaning.
- \*\* Ref: Pug the magician

## Why Bother?

Why bother? All software today is in JAVA or some other HLL anyway?

- Essential for understanding (lower level of)
  COMPILERS, LINKERS, OS.
- Architecture has impact on performance.
  Writing a program for better
  PERFORMANCE, even in a HLL, requires understanding computer architecture.
- Some EMBEDDED CPUs: only assembly language available
- Some code (part of the OS) STILL done in assembly language.
- Better understanding of security aspects.
- Viruses and anti-viruses.
- Reverse engineering, hacking, and patching.
- Everything is data.

# Role of Course in Curriculum

- Understanding of PHYSICAL implementations of structures from data-structures course.
- Can be seen as high-level of ``Digital Systems" course.
- Understanding of computer operation at the subsystem level.
- Leads up to ``Compilers' and "Operating Systems" as an ``enabling technology"
- Compilers course compilers use assembly language or machine code as end product.
- Systems programming the programmer's interface to the OS.

## Course outline

## **LECTURES (including SPlab (\*))**

- 1) \*Introduction to course and labs (week 1)
- 2) Basic architecture and LOW-LEVEL programming issues. (weeks 2-5)
- 3) \*Linux system services, shell (Week 6)
- 4) Assembly programming (weeks 7,8)
- 5) \*ELF format, linking and loading (week 9)
- 6) Advanced LOW-LEVEL prog. (wks 10-12)
- 7) Communication. (week 13)

## LABS:

- Simple C programs (weeks 1, 3)
- Debugging, system calls (weeks 4, 5)
- Command interpreter (weeks 7,8)
- Handling ELF files (weeks 10,11,12)

# Programmer's View of Computing

## To program a computer:

- Write a program in a source language (e.g. C)
- COMPILER converts program into MACHINE CODE or ASSEMBLY LANGUAGE
- 3. ASSEMBLER converts program into MACHINE CODE (object code file)
- 4. LINKER links OBJECT CODE modules into EXECUTABLE file
- LOADER loads EXECUTABLE code into memory to be run

## Advanced issues modify simplified model:

- 1. Dynamic linking/loading
- 2. Virtual memory

# Program Execution Basics (von-Neumann Architecture)

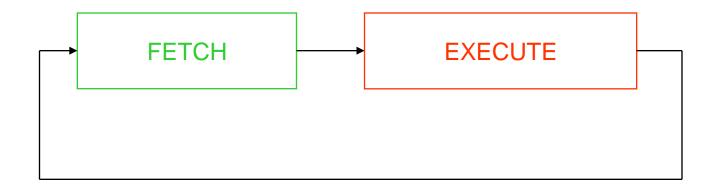

Computer executes a PROGRAM stored in MEMORY.

Basic scheme is - DO FOREVER:

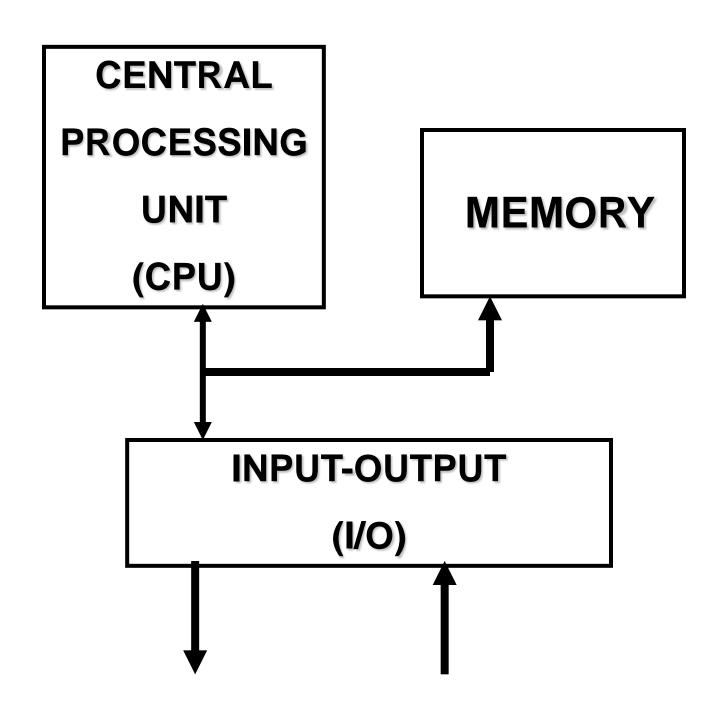

- 1. FETCH an instruction (from memory).
- 2. EXECUTE the instruction.

This is the FETCH-EXECUTE cycle.

More complicated in REAL machines (e.g. interrupts).
